Chapter 1

Hierarchical Index

1.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

aq::Breeder	8
aq::Color	13
aq::Breeder::Dependency	15
aq::Engine	16
aq::Fish	18
aq::Force	20
aq::AlignmentForce	5
aq::CohesionForce	10
aq::IslandForce	25
aq::MinSpeedForce	32
aq::MouseForce	35
aq::SeparationForce	44
aq::SpeciesCohesionForce	49
aq::WaterResistanceForce	54
aq::Island	24
aq::Net::LocalizedIterator	29
aq::Island::Map	31
aq::Net	39
shader::PerlinNoise	41
aq::Breeder::Settings	48
vec	51

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

aq::AlignmentForce	
Fish want to swim in the same direction and speed	5
aq::Breeder	8
aq::CohesionForce	
Fish want to stay close to each other	10
aq::Color	13
aq::Breeder::Dependency	15
aq::Engine	16
aq::Fish	18
aq::Force	
A force that can be applied to a fish	20
aq::Island	24
aq::IslandForce	
Fish want to stay in the water	25
aq::Net::LocalizedIterator	
Iterates over the cells in the visual range of a fish	29
aq::Island::Map	
A non-copyable class that represents the map of the islands	31
aq::MinSpeedForce	
Fish dont want to go too slow	32
aq::MouseForce	
Fish fear the mouse	35
aq::Net	
The net stores the fish and provides a cell based LUT	39
shader::PerlinNoise	
Simple 2D perlin noise shader	41
aq::SeparationForce	
Fish want to keep a safe distance from each other	44
aq::Breeder::Settings	48
aq::SpeciesCohesionForce	
Fish want to stay close to fish of the same species	49
vec	
A 2D vector	51
aq::WaterResistanceForce	
Fish get slowed down by the water	54

Chapter 3

Class Documentation

3.1 aq::AlignmentForce Class Reference

[Fish](#) want to swim in the same direction and speed.

```
#include <forces.hpp>
```

Inheritance diagram for aq::AlignmentForce:

Collaboration diagram for `aq::AlignmentForce`:

Public Member Functions

- **AlignmentForce** (double weight)
- virtual void **accum** (const **Fish** &near)
 - Should be called for each fish in the vicinity.*
- virtual void **finalize** ()
 - After accumulation finalize the calculation.*

- virtual [Force](#) * `clone` ()
Clones the force.

Protected Attributes

- `size_t n_of_close` {0}

3.1.1 Detailed Description

[Fish](#) want to swim in the same direction and speed.

3.1.2 Member Function Documentation

3.1.2.1 `clone()`

```
virtual Force* aq::AlignmentForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

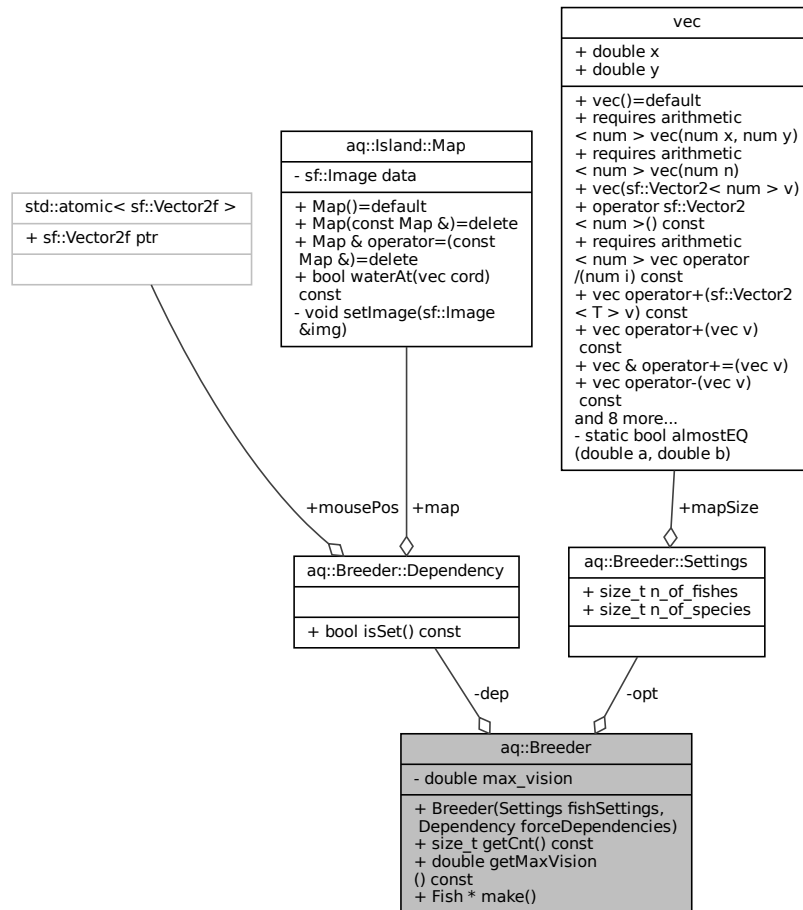

Implements [aq::Force](#).

The documentation for this class was generated from the following file:

- `inc/forces.hpp`

3.2 aq::Breeder Class Reference

Collaboration diagram for aq::Breeder:

Classes

- struct [Dependency](#)
- struct [Settings](#)

Public Member Functions

- **Breeder** ([Settings](#) fishSettings, [Dependency](#) forceDependencies)
- `size_t` **getCnt** () const
- `double` **getMaxVision** () const
Returns the furthest distance a fish can see.
- `Fish *` **make** ()
Generates the fishes.

Private Attributes

- const [Settings](#) opt
- const [Dependency](#) dep
- double max_vision = 0

3.2.1 Member Function Documentation

3.2.1.1 getMaxVision()

```
double aq::Breeder::getMaxVision ( ) const [inline]
```

Returns the furthest distance a fish can see.

Warning

Only callable after fish generation!

3.2.1.2 make()

```
Fish * Breeder::make ( )
```

Generates the fishes.

Returns

an array of the generated fishes, deletion is the callers responsibility

The documentation for this class was generated from the following files:

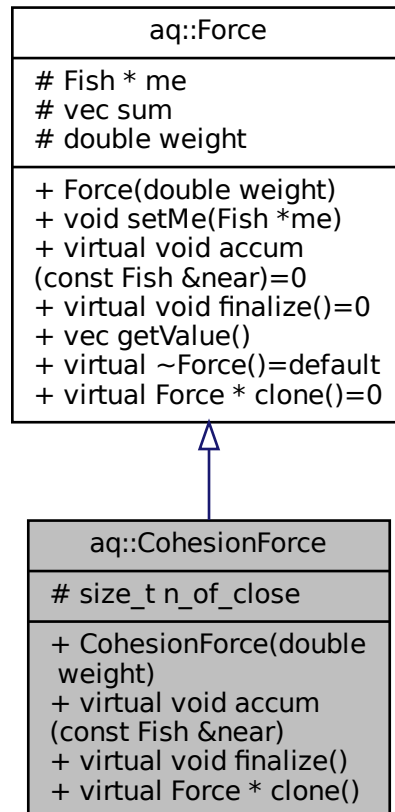

- inc/breeder.hpp
- src/breeder.cpp

3.3 aq::CohesionForce Class Reference

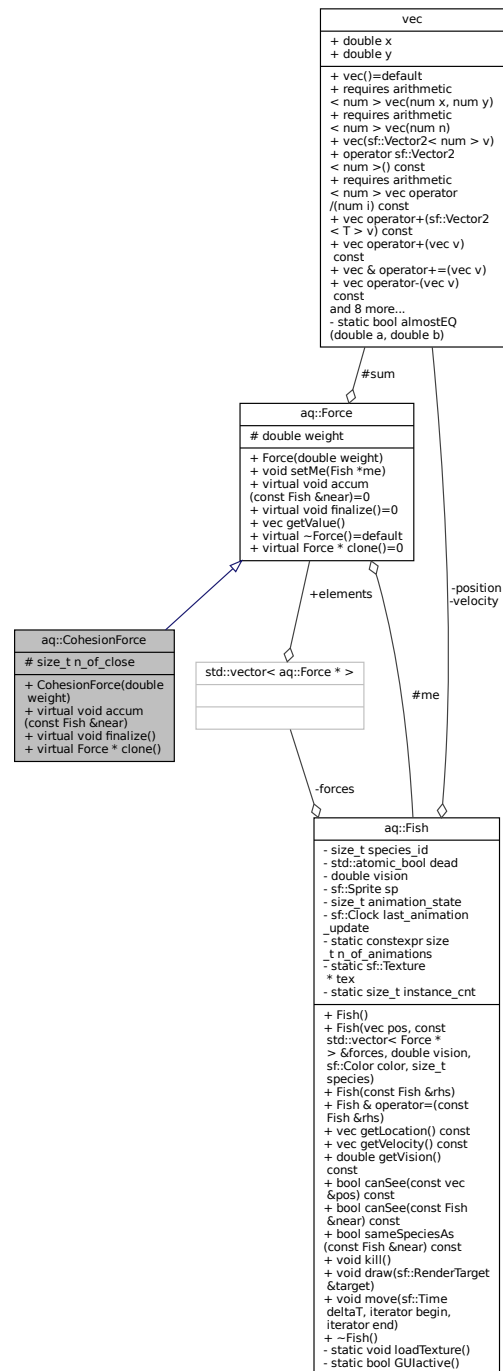

[Fish](#) want to stay close to each other.

```
#include <forces.hpp>
```

Inheritance diagram for aq::CohesionForce:

Collaboration diagram for aq::CohesionForce:

Public Member Functions

- **CohesionForce** (double weight)
- virtual void **accum** (const **Fish** &near)

Should be called for each fish in the vicinity.
- virtual void **finalize** ()

After accumulation finalize the calculation.

- virtual [Force](#) * [clone](#) ()
Clones the force.

Protected Attributes

- `size_t n_of_close {0}`

3.3.1 Detailed Description

[Fish](#) want to stay close to each other.

3.3.2 Member Function Documentation

3.3.2.1 [clone\(\)](#)

```
virtual Force* aq::CohesionForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

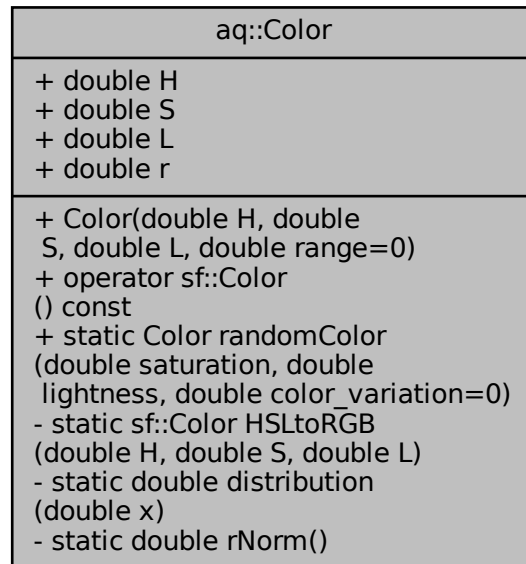

Implements [aq::Force](#).

The documentation for this class was generated from the following file:

- `inc/forces.hpp`

3.4 aq::Color Class Reference

Collaboration diagram for aq::Color:

Public Member Functions

- [Color](#) (double H, double S, double L, double range=0)
- **operator sf::Color** () const

Static Public Member Functions

- static [Color randomColor](#) (double saturation, double lightness, double color_variation=0)
Generate a random color centered with a distribution.

Public Attributes

- double **H**
- double **S**
- double **L**
- double **r**

Static Private Member Functions

- static sf::Color [HSLtoRGB](#) (double H, double S, double L)
- static double **distribution** (double x)
- static double **rNorm** ()

3.4.1 Constructor & Destructor Documentation

3.4.1.1 Color()

```
aq::Color::Color (
    double H,
    double S,
    double L,
    double range = 0 ) [inline]
```

Parameters

<i>H</i>	Hue [0,360)
<i>S</i>	Saturation [0,1]
<i>L</i>	Lightness [0,1]
<i>range</i>	allowed +- from hue

3.4.2 Member Function Documentation

3.4.2.1 HSLtoRGB()

```
sf::Color Color::HSLtoRGB (
    double H,
    double S,
    double L ) [static], [private]
```

Equations from https://en.wikipedia.org/wiki/HSL_and_HSV

3.4.2.2 randomColor()

```
static Color aq::Color::randomColor (
    double saturation,
    double lightness,
    double color_variation = 0 ) [inline], [static]
```

Generate a random color centered with a distribution.

Parameters

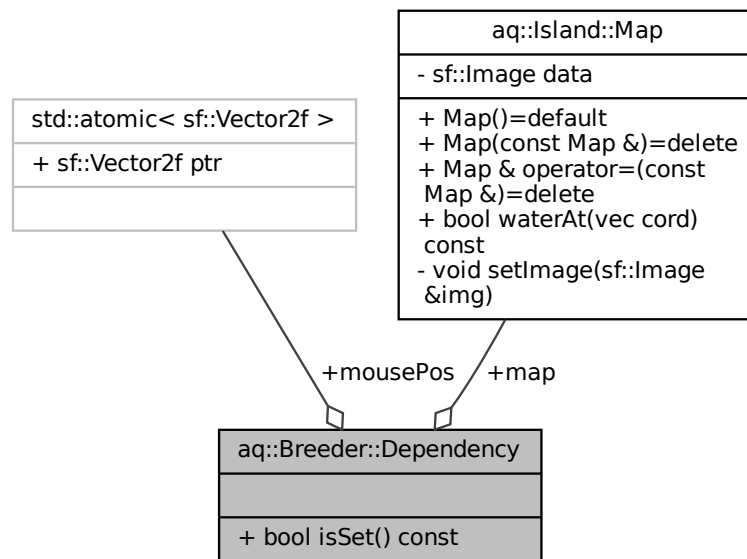

<i>hue_center</i>	[0,360)
<i>hue_range</i>	allowed +- from center
<i>color_variation</i>	randomness of rgb generated from the returned color

The documentation for this class was generated from the following files:

- inc/color.hpp
- src/color.cpp

3.5 aq::Breeder::Dependency Struct Reference

Collaboration diagram for aq::Breeder::Dependency:

Public Member Functions

- bool **isSet** () const

Public Attributes

- const [Island::Map](#) * **map**
- const std::atomic< sf::Vector2f > * **mousePos**

The documentation for this struct was generated from the following file:

- inc/breeder.hpp

Collaboration diagram for `aq::Engine`:

- Generated by Doxygen

- void [startParallelLife](#) ()
Starts the background process for the calculations.
- bool [isRunning](#) () const
Stops the background process for the calculations.
- void **handleEvents** ()

Private Member Functions

- void **zoomViewAt** ([vec](#) pixel, bool in)
- void **resetView** ()

Private Attributes

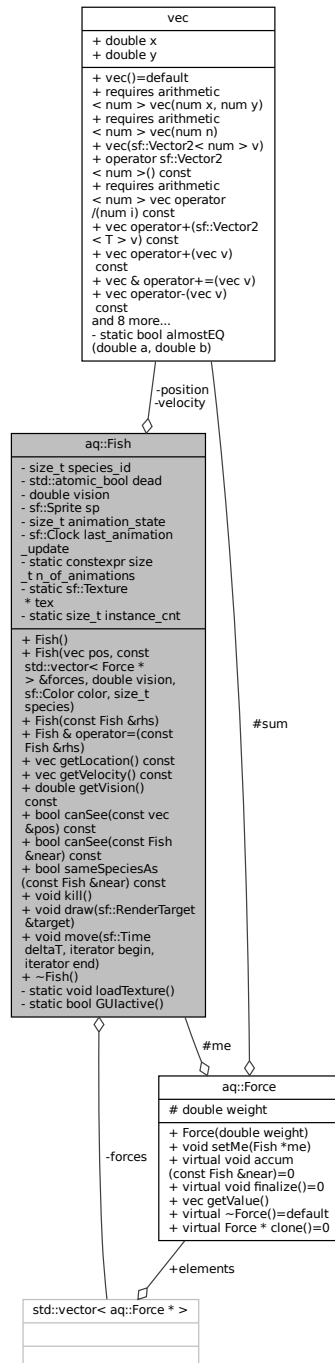

- sf::RenderWindow * **window**
- [Net](#) * **net**
- [Island](#) * **island**
- const float **zoomAmount** = 1.3F
- std::jthread **bgLife**
- std::atomic< sf::Vector2f > [mousePosition](#)
The position of the mouse for objects that cannot access the window.

The documentation for this class was generated from the following files:

- inc/engine.hpp
- src/engine.cpp
- src/event_handler.cpp

3.7 aq::Fish Class Reference

Collaboration diagram for aq::Fish:

Public Member Functions

- **Fish** (`vec` pos, const `std::vector< Force * >` &forces, double vision, `sf::Color` color, `size_t` species)
- **Fish** (const `Fish` &rhs)

- `Fish & operator=` (const `Fish` &rhs)
- `vec getLocation` () const
- `vec getVelocity` () const
- `double getVision` () const
- `bool canSee` (const `vec` &pos) const
- `bool canSee` (const `Fish` &near) const
- `bool sameSpeciesAs` (const `Fish` &near) const
- `void kill` ()
Kills the fish.
- `void draw` (sf::RenderTarget &target)
- `template<typename iterator >`
`void move` (sf::Time deltaT, iterator begin, iterator end)
Moves the fish according to it's internal forces.

Static Private Member Functions

- `static void loadTexture` ()
Loads the textures.
- `static bool GUIactive` ()

Private Attributes

- `vec position`
- `vec velocity`
- `std::vector< Force * > forces`
- `size_t species_id`
- `std::atomic_bool dead` {false}
- `double vision`
- `sf::Sprite sp`
- `size_t animation_state` {0}
- `sf::Clock last_animation_update`

Static Private Attributes

- `static constexpr size_t n_of_animations` = 4
- `static sf::Texture * tex` = nullptr
- `static size_t instance_cnt` = 0
Number of instances for texture deletion.

3.7.1 Member Function Documentation

3.7.1.1 kill()

```
void aq::Fish::kill ( ) [inline]
```

Kills the fish.

Changes the texture to a skeleton, it will no longer move or effect other fish

3.7.1.2 loadTexture()

```
void Fish::loadTexture ( ) [static], [private]
```

Loads the textures.

Only loads them if they haven't been loaded yet and if there is a GUI

3.7.1.3 move()

```
template<typename iterator >
void aq::Fish::move (
    sf::Time deltaT,
    iterator begin,
    iterator end ) [inline]
```

Moves the fish according to it's internal forces.

Template Parameters

<i>iterator</i>	for a container of fish that effect *this
-----------------	---

Parameters

<i>deltaT</i>	time passed since last move call
---------------	----------------------------------

The documentation for this class was generated from the following files:

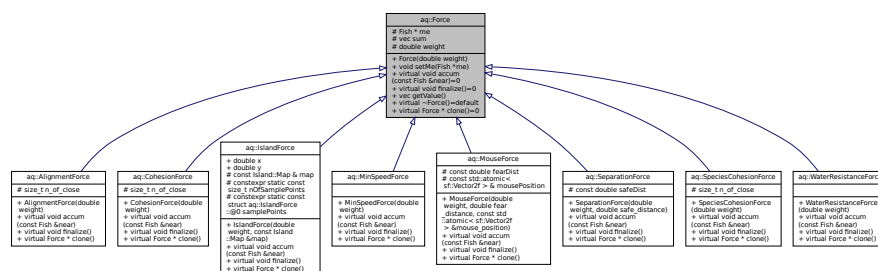

- inc/fish.hpp
- src/fish.cpp

3.8 aq::Force Class Reference

A force that can be applied to a fish.

```
#include <force.hpp>
```

Inheritance diagram for aq::Force:

Collaboration diagram for aq::Force:

Public Member Functions

- **Force** (double weight)
- void **setMe** (Fish *me)
Sets the fish that is containing this force.
- virtual void **accum** (const Fish &near)=0
Should be called for each fish in the vicinity.

- virtual void `finalize` ()=0
After accumulation finalize the calculation.
- `vec` `getValue` ()
Returns the calculated value of the force and resets it.
- virtual `Force` * `clone` ()=0
Clones the force.

Protected Attributes

- `Fish` * `me` {nullptr}
- `vec` `sum` {0, 0}
- double `weight`

3.8.1 Detailed Description

A force that can be applied to a fish.

Order of operations:

1. `accum`
2. `finalize`
3. `getValue`

3.8.2 Member Function Documentation

3.8.2.1 `clone()`

```
virtual Force* aq::Force::clone ( ) [pure virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the `me` pointer reset

Implemented in `aq::IslandForce`, `aq::MouseForce`, `aq::MinSpeedForce`, `aq::WaterResistanceForce`, `aq::SpeciesCohesionForce`, `aq::CohesionForce`, `aq::AlignmentForce`, and `aq::SeparationForce`.

3.8.2.2 setMe()

```
void Force::setMe (
    Fish * me )
```

Sets the fish that is containing this force.

Warning

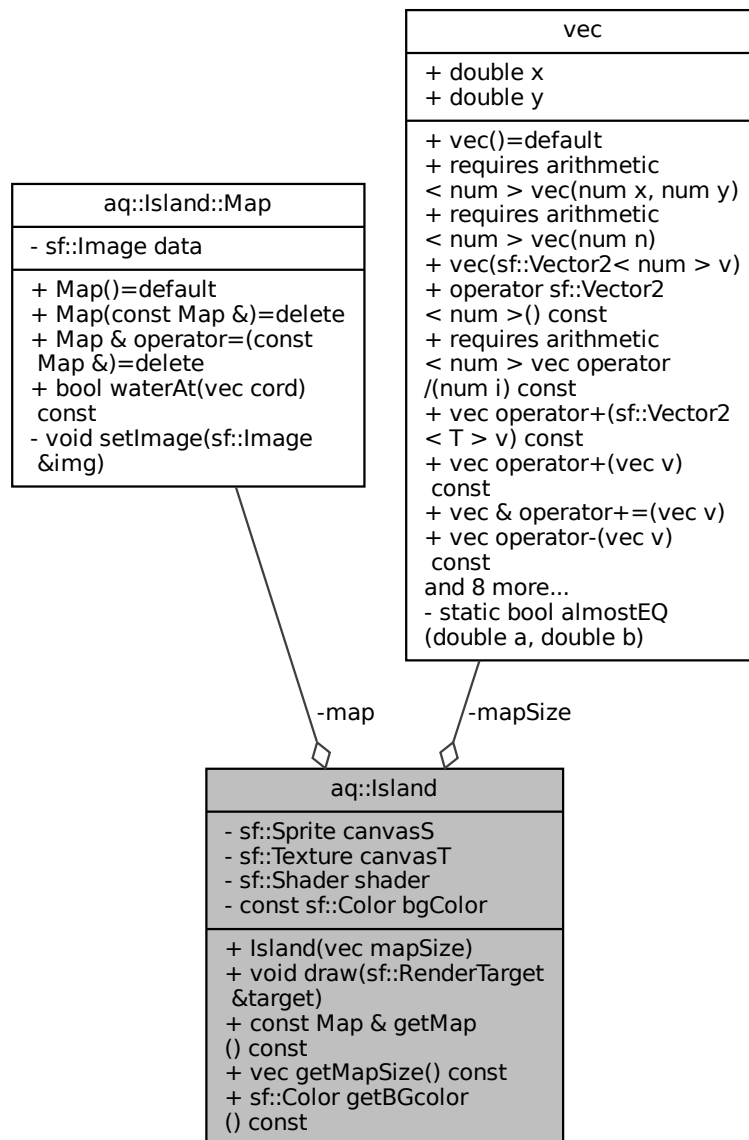

Must be set before using the force

The documentation for this class was generated from the following files:

- inc/force.hpp
- src/force.cpp

3.9 aq::Island Class Reference

Collaboration diagram for aq::Island:

Classes

- struct [Map](#)

A non-copyable class that represents the map of the islands.

Public Member Functions

- [Island](#) ([vec](#) mapSize)

Loads the openGL(GLSL) shader.

- void **draw** (sf::RenderTarget &target)
- const **Map** & **getMap** () const
- **vec** **getMapSize** () const
- sf::Color **getBGcolor** () const

Private Attributes

- sf::Sprite **canvasS**
- sf::Texture **canvasT**
- sf::Shader **shader**
- **vec** **mapSize**
- **Map** **map**
- const sf::Color **bgColor** = sf::Color(19, 109, 21)

3.9.1 Constructor & Destructor Documentation

3.9.1.1 Island()

```
Island::Island (
    vec mapSize ) [explicit]
```

Loads the openGL(GLSL) shader.

Exceptions

<i>if</i>	an error occurs while loading and compiling the shader
-----------	--

The documentation for this class was generated from the following files:

- inc/island.hpp
- src/island.cpp

3.10 aq::IslandForce Class Reference

Fish want to stay in the water.

```
#include <forces.hpp>
```

Inheritance diagram for aq::IslandForce:

Collaboration diagram for aq::IslandForce:

Public Member Functions

- **IslandForce** (double weight, const **Island::Map** &map)
- virtual void **accum** (const **Fish** &near)
Should be called for each fish in the vicinity.
- virtual void **finalize** ()
After accumulation finalize the calculation.

- virtual `Force * clone ()`
Clones the force.

Protected Attributes

- const `Island::Map & map`

Static Protected Attributes

- constexpr static const size_t `nOfSamplePoints` = 36
- struct {
 double `x`
 double `y`
} `samplePoints` [`nOfSamplePoints`]

3.10.1 Detailed Description

`Fish` want to stay in the water.

3.10.2 Member Function Documentation

3.10.2.1 clone()

```
virtual Force* aq::IslandForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

Implements `aq::Force`.

3.10.3 Member Data Documentation

3.10.3.1

```
constexpr { ... } aq::IslandForce::samplePoints[nOfSamplePoints] [static], [protected]
```

Initial value:

```
=  
    {{1.000, 0.000}, {0.940, 0.342}, {0.766, 0.643}, {0.500, 0.866}, {0.174, 0.985}, {-0.174, 0.985},  
    {-0.500, 0.866}, {-0.766, 0.643}, {-0.940, 0.342}, {-1.000, 0.000}, {-0.940, -0.342}, {-0.766,  
    -0.643}, {-0.500, -0.866}, {-0.174, -0.985}, {0.174, -0.985}, {0.500, -0.866}, {0.766, -0.643},  
    {0.940, -0.342}, {0.667, 0.000}, {0.577, 0.333}, {0.333, 0.577}, {0.000, 0.667}, {-0.333, 0.577},  
    {-0.577, 0.333}, {-0.667, 0.000}, {-0.577, -0.333}, {-0.333, -0.577}, {-0.000, -0.667}, {0.333,  
    -0.577}, {0.577, -0.333}, {0.333, 0.000}, {0.167, 0.289}, {-0.167, 0.289}, {-0.333, 0.000}, {-0.167,  
    -0.289}, {0.167, -0.289}}
```

The documentation for this class was generated from the following file:

- inc/forces.hpp

3.11 aq::Net::LocalizedIterator Class Reference

Iterates over the cells in the visual range of a fish.

```
#include <net.hpp>
```

- [LocalizedIterator](#) **operator++** (int)
- bool **operator!=** (const [LocalizedIterator](#) &rhs)

Private Member Functions

- [vec](#) **currCord** () const
- void **updateIeters** ()

Private Attributes

- [Net](#) & **net**
- const [vec](#) **centerCord**
- cell::iterator **currIter**
- cell::iterator **currEnd**
- size_t **idx** {0}

3.11.1 Detailed Description

Iterates over the cells in the visual range of a fish.

The documentation for this class was generated from the following files:

- inc/net.hpp
- src/iter.cpp

3.12 aq::Island::Map Struct Reference

A non-copyable class that represents the map of the islands.

```
#include <island.hpp>
```

Collaboration diagram for aq::Island::Map:

aq::Island::Map
- sf::Image data
+ Map()=default + Map(const Map &)=delete + Map & operator=(const Map &)=delete + bool waterAt(vec cord) const - void setImage(sf::Image &img)

Public Member Functions

- **Map** (const [Map](#) &)=delete
- [Map](#) & **operator=** (const [Map](#) &)=delete
- bool **waterAt** ([vec](#) cord) const

Private Member Functions

- void **setImage** (sf::Image &img)

Private Attributes

- sf::Image **data**

Friends

- class **Island**

3.12.1 Detailed Description

A non-copyable class that represents the map of the islands.

The documentation for this struct was generated from the following files:

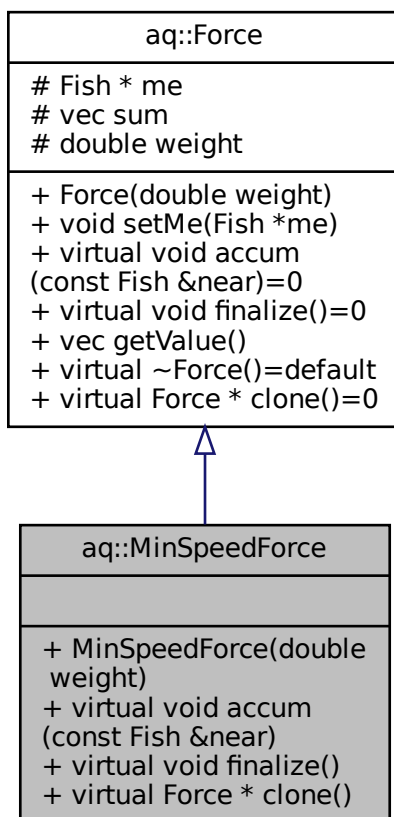

- inc/island.hpp
- src/island.cpp

3.13 [aq::MinSpeedForce](#) Class Reference

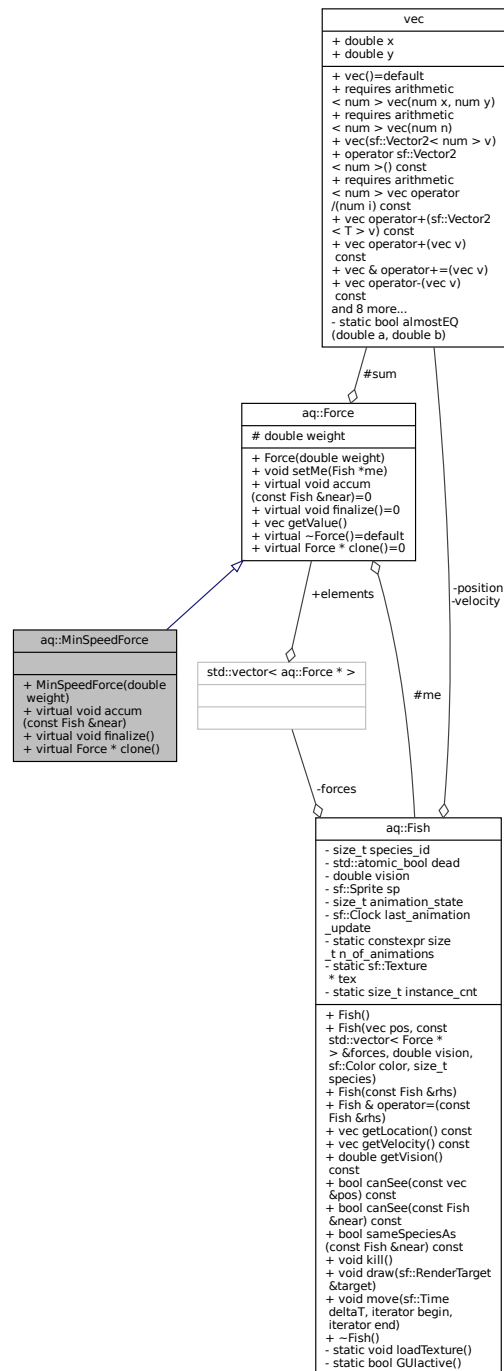

[Fish](#) dont want to go too slow.

```
#include <forces.hpp>
```

Inheritance diagram for aq::MinSpeedForce:

Collaboration diagram for `aq::MinSpeedForce`:

Public Member Functions

- **MinSpeedForce** (double weight)
- virtual void **accum** (const **Fish** &near)
 - Should be called for each fish in the vicinity.*
- virtual void **finalize** ()
 - After accumulation finalize the calculation.*

- virtual `Force * clone ()`
Clones the force.

Additional Inherited Members

3.13.1 Detailed Description

`Fish` dont want to go too slow.

3.13.2 Member Function Documentation

3.13.2.1 `clone()`

```
virtual Force* aq::MinSpeedForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

Implements `aq::Force`.

The documentation for this class was generated from the following file:

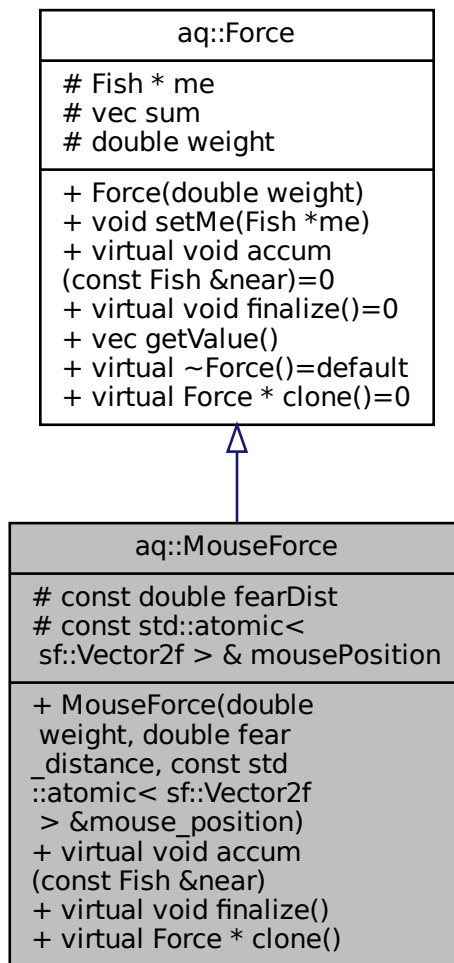

- `inc/forces.hpp`

3.14 `aq::MouseForce` Class Reference

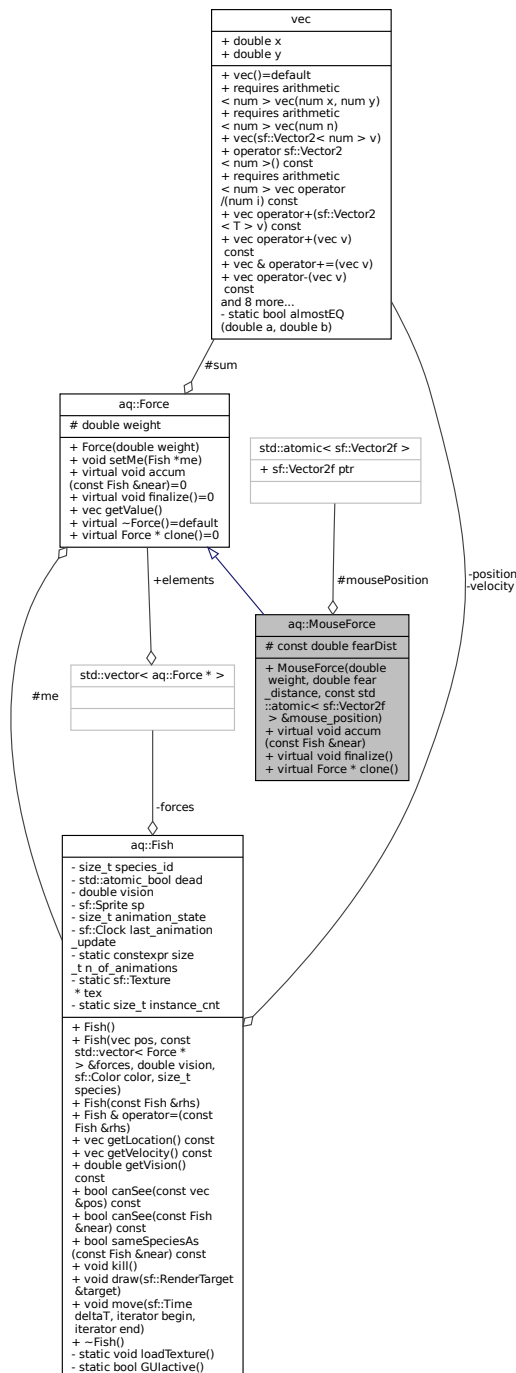

`Fish` fear the mouse.

```
#include <forces.hpp>
```

Inheritance diagram for `aq::MouseForce`:

Collaboration diagram for aq::MouseForce:

Public Member Functions

- **MouseForce** (double weight, double fear_distance, const std::atomic< sf::Vector2f > &mouse_position)
- virtual void **accum** (const Fish &near)
 - Should be called for each fish in the vicinity.*
- virtual void **finalize** ()
 - After accumulation finalize the calculation.*

- virtual [Force](#) * [clone](#) ()
Clones the force.

Protected Attributes

- const double **fearDist**
- const std::atomic< sf::Vector2f > & **mousePosition**

3.14.1 Detailed Description

[Fish](#) fear the mouse.

3.14.2 Member Function Documentation

3.14.2.1 [clone\(\)](#)

```
virtual Force* aq::MouseForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

Implements [aq::Force](#).

The documentation for this class was generated from the following file:

- inc/forces.hpp

3.15 aq::Net Class Reference

The net stores the fish and provides a cell based LUT.

```
#include <net.hpp>
```

Collaboration diagram for aq::Net:

Classes

- class [LocalizedIterator](#)
Iterates over the cells in the visual range of a fish.

Public Types

- typedef std::list< [Fish](#) * > **cell**

Public Member Functions

- **Net** ([Breeder](#) breeder, size_t mapSize=1000)
- void **draw** (sf::RenderTarget &target)
- void [moveFishWhile](#) (std::stop_token live)
Infinitely loop that moves the fish until another thread sets live to false.

Private Member Functions

- **vec** [getCord](#) (const [Fish](#) &fish) const
- cell & **at** (**vec** cord)
- [LocalizedIterator](#) **begin** (const [Fish](#) ¢erFish)
- [LocalizedIterator](#) **end** (const [Fish](#) ¢erFish)
- [Fish](#) * **begin** ()
- [Fish](#) * **end** ()

Private Attributes

- const size_t **fish_cnt**
- [Fish](#) * **storage**
- const size_t **mapSize**
- sf::Clock **lastUpdate**
- std::mutex **working**
- cell ** **grid**
- double **cellSize**
- size_t **cellCnt**

3.15.1 Detailed Description

The net stores the fish and provides a cell based LUT.

3.15.2 Member Function Documentation

3.15.2.1 moveFishWhile()

```
void Net::moveFishWhile (
    std::stop_token live )
```

Infinitely loop that moves the fish until another thread sets live to false.

Returns

after live is set to false and the last iteration is finished

The documentation for this class was generated from the following files:

- inc/net.hpp
- src/net.cpp

3.16 shader::PerlinNoise Class Reference

Simple 2D perlin noise shader.

Collaboration diagram for shader::PerlinNoise:

shader::PerlinNoise
+ uniform vec2 u_map_size + uniform float u_edge_ratio + uniform vec2 u_seed + uniform int u_octaves + uniform float u_gridSize + uniform float u_amplitude + uniform float u_water_level + uniform float u_sand_level + uniform float u_bw_mode + uniform vec4 col_low_water and 8 more...
+ float interpolate(float a, float b, float w) + float cap(float value) + vec2 randomGradient(ivec2 cord) + float dotGridGradient(ivec2 cord, vec2 pos) + float perlin(vec2 pos) + float fractalNoise(vec2 pos) + vec4 colorFromHeight(float height) + vec2 slope(vec2 pos) + float edgeCurve(vec2 pos) + void main()

Public Member Functions

- float [interpolate](#) (float a, float b, float w)
Smoothly interpolates between two values.
- float [cap](#) (float value)
Caps a value between [0, 1].
- vec2 [randomGradient](#) (ivec2 cord)
Computes a pseudo random gradient vector for a given integer coordinate.
- float [dotGridGradient](#) (ivec2 cord, vec2 pos)
Computes the dot product of a random gradient vector and a given position.
- float [perlin](#) (vec2 pos)
2D Perlin noise
- float [fractalNoise](#) (vec2 pos)
Computes a fractal sum of perlin noise.
- vec4 [colorFromHeight](#) (float height)
Computes a color based on the height.
- vec2 [slope](#) (vec2 pos)
- float [edgeCurve](#) (vec2 pos)
- void [main](#) ()
Main function.

Public Attributes

- uniform vec2 [u_map_size](#)
Size of the map.
- uniform float [u_edge_ratio](#)
Point where the edge starts to curve up.
- uniform vec2 [u_seed](#)
Seed used as offset.
- uniform int [u_octaves](#)
Number of patterns to sum.
- uniform float [u_gridSize](#)
Size of the grid.
- uniform float [u_amplitude](#)
Start amplitude of the noise.
- uniform float [u_water_level](#)
Threshold for water [0, 1].
- uniform float [u_sand_level](#)
Threshold for sand [0, 1].
- uniform float [u_bw_mode](#)
B&W mask mode toggle, 0 or 1.
- uniform vec4 [col_low_water](#)
Color for deep water.
- uniform vec4 [col_high_water](#)
Color for shallow water.
- uniform vec4 [col_low_sand](#)
Color for low sand.
- uniform vec4 [col_high_sand](#)
Color for high sand.
- uniform vec4 [col_low_grass](#)

Color for low grass.

- uniform vec4 [col_high_grass](#)

Color for high grass.

- uniform vec2 [u_resolution](#)

Size of the window.

- uniform vec2 [u_top_left](#)

Top left corner of the visible area.

- uniform vec2 [u_bottom_right](#)

Bottom right corner of the visible area.

3.16.1 Detailed Description

Simple 2D perlin noise shader.

Code based on the the Perlin noise wikipedia page: https://en.wikipedia.org/wiki/Perlin_noise

Remarks

Fragment-Shader

3.16.2 Member Function Documentation

3.16.2.1 colorFromHeight()

```
vec4 shader::PerlinNoise::colorFromHeight (
    float height ) [inline]
```

Computes a color based on the height.

Parameters

<i>height</i>	in [0, 1]
---------------	-----------

3.16.2.2 fractalNoise()

```
float shader::PerlinNoise::fractalNoise (
    vec2 pos ) [inline]
```

Computes a fractal sum of perlin noise.

Returns

[0, 1]

3.16.2.3 perlin()

```
float shader::PerlinNoise::perlin (
    vec2 pos ) [inline]
```

2D Perlin noise

Parameters

<i>pos</i>	Position in 2D space
------------	----------------------

Returns

[-1, 1]

3.16.2.4 randomGradient()

```
vec2 shader::PerlinNoise::randomGradient (
    ivec2 cord ) [inline]
```

Computes a pseudo random gradient vector for a given integer coordinate.

Returns

Vector with length 1

The documentation for this class was generated from the following file:

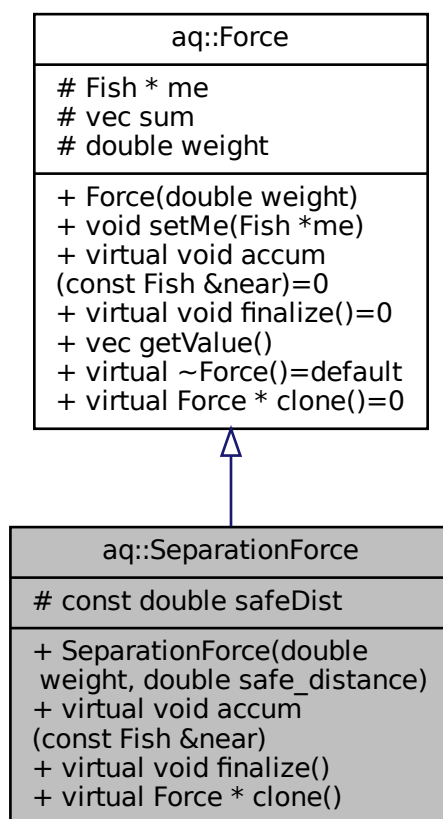

- src/perlin.frag

3.17 aq::SeparationForce Class Reference

[Fish](#) want to keep a safe distance from each other.

```
#include <forces.hpp>
```

Inheritance diagram for aq::SeparationForce:

Collaboration diagram for `aq::SeparationForce`:

Public Member Functions

- **SeparationForce** (double weight, double safe_distance)
 - virtual void **accum** (const **Fish** &near)
 - virtual void **finalize** ()
- Should be called for each fish in the vicinity.*
- After accumulation finalize the calculation.*

- virtual `Force * clone ()`
Clones the force.

Protected Attributes

- const double `safeDist`

3.17.1 Detailed Description

`Fish` want to keep a safe distance from each other.

3.17.2 Member Function Documentation

3.17.2.1 `clone()`

```
virtual Force* aq::SeparationForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

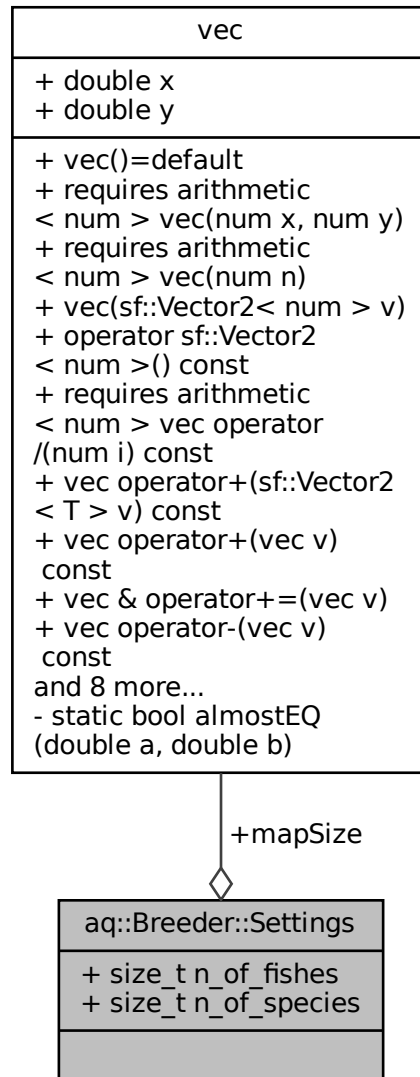

Implements `aq::Force`.

The documentation for this class was generated from the following file:

- `inc/forces.hpp`

3.18 aq::Breeder::Settings Struct Reference

Collaboration diagram for aq::Breeder::Settings:

Public Attributes

- `size_t n_of_fishes` = 100
- `size_t n_of_species` = 1
- `vec mapSize`

The documentation for this struct was generated from the following file:

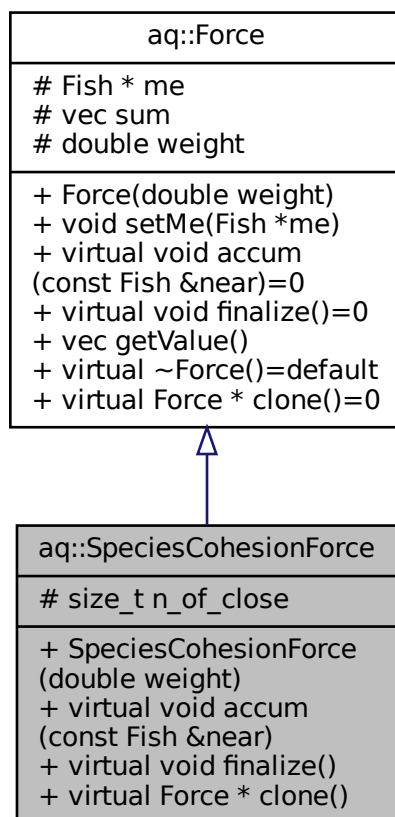

- `inc/breeder.hpp`

3.19 aq::SpeciesCohesionForce Class Reference

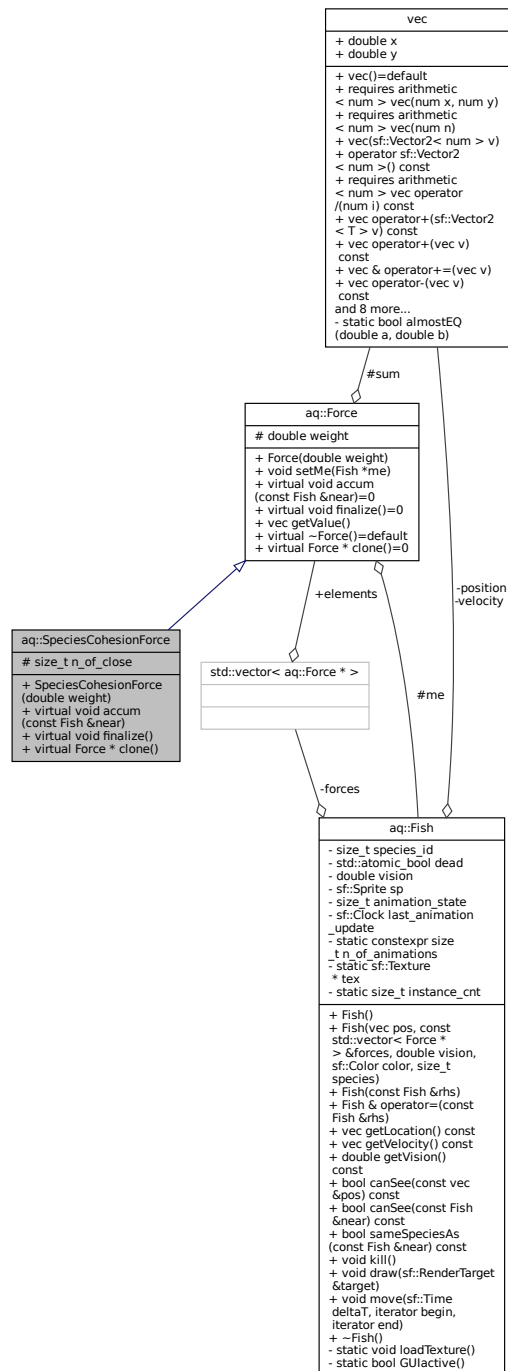

[Fish](#) want to stay close to fish of the same species.

```
#include <forces.hpp>
```

Inheritance diagram for aq::SpeciesCohesionForce:

Collaboration diagram for `aq::SpeciesCohesionForce`:

Public Member Functions

- **SpeciesCohesionForce** (double weight)
- virtual void **accum** (const **Fish** &near)
Should be called for each fish in the vicinity.
- virtual void **finalize** ()
After accumulation finalize the calculation.

- virtual [Force](#) * [clone](#) ()
Clones the force.

Protected Attributes

- `size_t n_of_close {0}`

3.19.1 Detailed Description

[Fish](#) want to stay close to fish of the same species.

3.19.2 Member Function Documentation

3.19.2.1 [clone\(\)](#)

```
virtual Force* aq::SpeciesCohesionForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

Implements [aq::Force](#).

The documentation for this class was generated from the following file:

- `inc/forces.hpp`

3.20 vec Struct Reference

A 2D vector.

```
#include <vec.hpp>
```

Collaboration diagram for vec:

vec
+ double x + double y
+ vec()=default + requires arithmetic < num > vec(num x, num y) + requires arithmetic < num > vec(num n) + vec(sf::Vector2< num > v) + operator sf::Vector2 < num >() const + requires arithmetic < num > vec operator /(num i) const + vec operator+(sf::Vector2 < T > v) const + vec operator+(vec v) const + vec & operator+=(vec v) + vec operator-(vec v) const and 8 more... - static bool almostEQ (double a, double b)

Public Member Functions

- template<typename num >
requires arithmetic< num > **vec** (num x, num y)
- template<typename num >
requires arithmetic< num > **vec** (num n)
- template<typename num >
vec (sf::Vector2< num > v)
- template<typename num >
operator sf::Vector2< num > () const
- template<typename num >
requires arithmetic< num > **vec operator/** (num i) const

vec operator+ (sf::Vector2< T > v) const
- **vec operator+** (vec v) const
- **vec & operator+=** (vec v)
- **vec operator-** (vec v) const
- template<typename T >
vec operator- (sf::Vector2< T > v) const
- **vec & operator-=** (vec v)
- bool **operator==** (vec v) const

- true if difference is less than 1.0E-10*
- bool **operator!=** ([vec](#) v) const
- double **len** () const
- [vec norm](#) () const
- Returns a normalized vector.*
- bool [wholeEQ](#) ([vec](#) v) const
- true if the whole part of the vector is equal*
- sf::Vector2< ssize_t > [whole](#) () const
- Rounds down the coordinates.*

Public Attributes

- double **x** {0}
- double **y** {0}

Static Private Member Functions

- static bool **almostEQ** (double a, double b)

Friends

- template<typename num >
requires arithmetic< num > friend [vec operator*](#) ([vec](#) v, num i)
- template<typename num >
requires arithmetic< num > friend [vec operator*](#) (num i, [vec](#) v)
- template<typename T >
[vec operator+](#) (sf::Vector2< T > v1, [vec](#) v2)
- template<typename T >
[vec operator-](#) (sf::Vector2< T > v1, [vec](#) v2)
- std::ostream & **operator<<** (std::ostream &os, [vec](#) v)

3.20.1 Detailed Description

A 2D vector.

Internally uses double for the coordinates Fully compatible with SFML's sf::Vector2 class

3.20.2 Member Function Documentation

3.20.2.1 norm()

```
vec vec::norm ( ) const [inline]
```

Returns a normalized vector.

Returns

if the length is less than 1.0E-10 a random direction is chosen

3.20.2.2 wholeEQ()

```
bool vec::wholeEQ (
    vec v ) const [inline]
```

true if the whole part of the vector is equal

rounds down

The documentation for this struct was generated from the following file:

- inc/vec.hpp

3.21 aq::WaterResistanceForce Class Reference

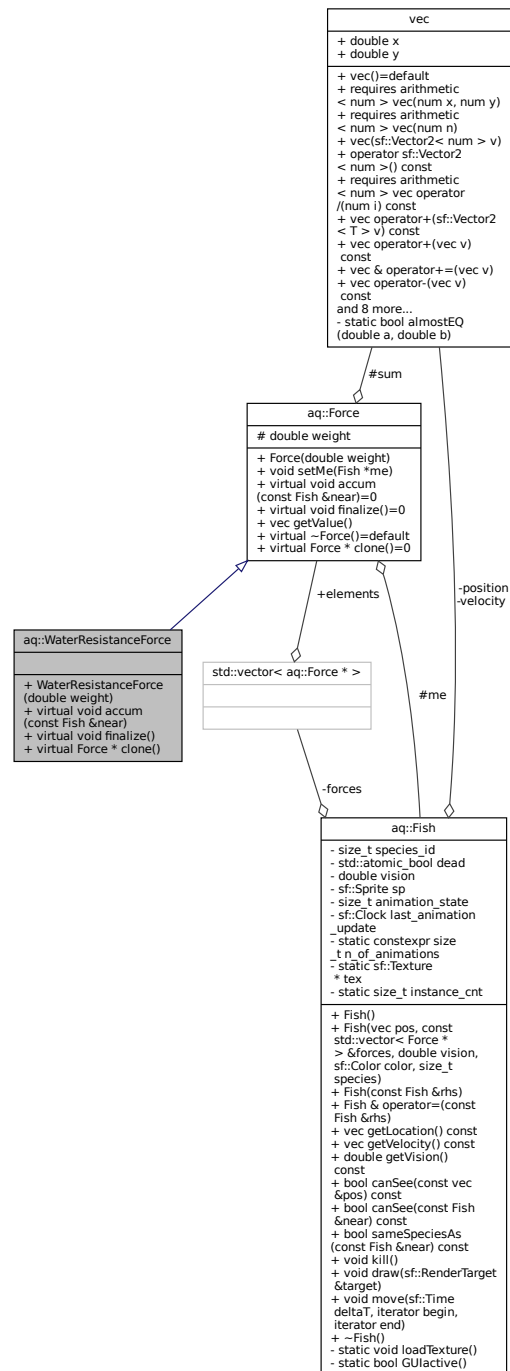

[Fish](#) get slowed down by the water.

```
#include <forces.hpp>
```

Inheritance diagram for aq::WaterResistanceForce:

Collaboration diagram for aq::WaterResistanceForce:

Public Member Functions

- **WaterResistanceForce** (double weight)
- virtual void **accum** (const **Fish** &near)
Should be called for each fish in the vicinity.
- virtual void **finalize** ()
After accumulation finalize the calculation.

- virtual [Force](#) * [clone](#) ()
Clones the force.

Additional Inherited Members

3.21.1 Detailed Description

[Fish](#) get slowed down by the water.

3.21.2 Member Function Documentation

3.21.2.1 [clone](#)()

```
virtual Force* aq::WaterResistanceForce::clone ( ) [inline], [virtual]
```

Clones the force.

Returns

A dynamically allocated copy of the force, with the me pointer reset

Implements [aq::Force](#).

The documentation for this class was generated from the following file:

- inc/forces.hpp
